

Script installation

1. Download the pack from the store, *Your Products* tab.
2. Copy the pack content into your server and unpack it in the app/Modules/ catalog.
3. Start the module in the script's admin panel in the *Settings - Manage Modules* section

Manual

The Facebook Login module allows to place a registration or login button via the Facebook account. To be able to use the module you first need to create an app on the Facebook website. It is required to have an account on Facebook. In order to create an application take the following steps:

1. Go to the website: <https://developers.facebook.com/>
2. Click the menu button at the upper right corner, and choose the *Add New App* option.
3. Select the Website option from the *Add New App* menu.
4. Enter the app name and click *Create New Facebook App ID*.
5. Check the option NO in the field *Is this a test version of another app*. Afterwards, enter your e-mail address and select the Applications for websites category and click *Create App ID*.
6. Enter the full address of your website in the *Tell us about your website* section and click *Next*.
7. The application is ready. Go to the list of you applications and select the one that you have just created, by clicking on it.
8. Information about the application presents *App ID* and the *Secret key*, which must be copied and pasted in the system settings.
9. The last step is to go to the *App Review* section and publish your application.

When the *App ID* and *App Secret* sections are filled, the registration and login page will automatically display a Facebook login or registration button. Everyone using this option will be also asked to set a username and a password for the account, which will be necessary to save changes in the profile, or in case of losing the Facebook account that is joined to the account on your website. While registering via Facebook, the system automatically downloads the first and last name of the user, their e-mail address and their avatar.
